

Type of procedure	Breast surgery (reduction / reconstruction / implants)
Airway	Endotracheal intubation.
Anesthesia model	General anesthesia ± TIVA for long procedures.
Premedication	Ondansetron ± Dexamethasone ± Paracetamol / COX inhibitor.
Postoperative analgesia	Multimodal analgesia. Consider regional blocks.
Notes	Major plastic surgery with long operative time. Risk of hypothermia and blood loss. Consider regional techniques (PECS / paravertebral block). Monitor fluid balance and pressure areas carefully.
Recommended vascular access	Peripheral IV ×2 (18–20G). Arterial line rarely required.
