

Type of procedure	Chin augmentation (genioplasty)
Airway	Nasotracheal intubation with preformed tube.
Anesthesia model	General anesthesia: Sevoflurane / Remifentanil or TIVA.
Premedication	Ondansetron ± Betamethasone ± Paracetamol / NSAID.
Postoperative analgesia	Clonidine ± opioids. Local infiltration by surgeon.
Notes	Shared airway surgery. Secure nasal tube carefully to allow surgical access. Consider throat pack and gastric tube if indicated.
Recommended vascular access	Peripheral IV ×2 (18–20G). Arterial line rarely required.
