

Type of procedure	Hepatic artery embolization
Airway	Sedation or intubation depending on patient and procedure extent
Anesthesia model	General anesthesia or local anesthesia with sedation
Epi / Spinal	–
Premedication	Paracetamol ± Ondansetron
Notes	Risk of post-embolization syndrome, hepatic ischemia, pain, fever, and nausea. Monitor liver function and hemodynamics closely.
Recommended vascular access	Peripheral IV x2 (≥18G). Arterial line recommended. Consider central venous access in high-risk patients.
