

Type of procedure	<b>Split-thickness skin graft</b>
<b>Airway</b>	Endotracheal intubation or laryngeal mask airway.
<b>Anesthesia model</b>	General anesthesia ± regional anesthesia.
<b>Premedication</b>	Ondansetron ± Dexamethasone ± Paracetamol / COX inhibitor.
<b>Postoperative analgesia</b>	Multimodal analgesia. Regional blocks strongly recommended.
<b>Notes</b>	<p>Donor site often more painful than graft site.  Consider regional techniques (femoral, fascia iliaca, TAP, ESP).  Local anesthetic infiltration at donor site beneficial.  Optimize analgesia to facilitate early mobilization.</p>
<b>Recommended vascular access</b>	Peripheral IV ×1–2 depending on extent and patient status.
