

|                             |                                                                                    |
|-----------------------------|------------------------------------------------------------------------------------|
| Type of procedure           | Acute subdural hematoma                                                            |
| Airway                      | Intubation                                                                         |
| Anesthesia model            | Propofol / Remifentanil                                                            |
| Epi / Spinal                | –                                                                                  |
| Premedication               | –                                                                                  |
| Notes                       | Often raised ICP with risk of herniation. Avoid hypotension.                       |
| Recommended vascular access | Peripheral IV x2 ( $\geq 18G$ ) + arterial line. Consider central venous catheter. |
