

|                             |                                                                                                                       |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Type of procedure           | TMS – tethered spinal cord                                                                                            |
| Airway                      | Intubation                                                                                                            |
| Anesthesia model            | Sevoflurane / Remifentanil                                                                                            |
| Epi / Spinal                | –                                                                                                                     |
| Premedication               | –                                                                                                                     |
| Notes                       | Clonidine may be considered. Gabapentin 300–600 mg for chronic pain. Postoperative pain common in multilevel surgery. |
| Recommended vascular access | Peripheral IV ×2 (18–20G). Arterial line for prolonged surgery or ASA ≥3. Consider CVC if instability risk.           |
